THE REAL-ZEROS OF JONES POLYNOMIAL OF TORUS

CHANG LI

Dedicated to My Parents.

ABSTRACT. This article proved two theorems and presented one conjecture about the real-zeros of Jones Polynomial of Torus. The distribution of zeros of Jones Polynomial is an interesting topic in knots theory of math and physics.

1. The Real-Zeros of Jones Polynomial of Torus

The real-zeros of Jones polynomial of torus $V_t(p,q)$ are distributed on x axis. In physics, since real-zeros of an equation usually represent observable values, it is interested to investigate them in advanced.

(1.1)
$$V_t(p,q) = 1 - t^{p+1} - t^{q+1} + t^{p+q}, t \in \mathbb{C}$$

Theorem 1. For all Jones polynomials of Torus V(p,q) there are two positive real-zeros with one is +1 and another is inside 1 < r < 2.

Proof. Suppose a positive real-zero of $V_t(p,q)$ is r where $0 < r < +\infty$, then there is a r so that $V_r(p,q) = 0$. By Cauchy theorem, $||r|| < 1 + max(||a_i||) \le 2$. We can represent $V_r(p,q) = 0$ as $(1 - r^p)(1 - r^q) = (r - 1)(r^p + r^q)$. If we suppose 0 < r < 1, then $0 < r^p < 1$ and $0 < r^q < 1$, the left side of equation is positive, but since r - 1 < 0, the right side is negative. So there is $1 \le r < 2$.

By Descartes' rule of signs, there are two signs change in the coefficients of equation (6), so there are two positive zeros. Obviously, +1 is a zero, another positive real-zero is in 1 < r < 2.

Theorem 2. For all Jones polynomials of Torus V(p,q), for both p and q are positive even integers, there are no negative zeros; for one of p or q is odd and another is even, there is one negative zero; for both p and q are odd, there are two negative zeros.

Proof. Replace -t in Jones polynomial $V_t(p,q)$ as $V_{-t}(p,q)$ Descartes's rule can be applied to decide all the negative real-zeros.

* Suppose p = 2m, q = 2n, then $V_{-t}(p,q) = 1 + t^{p+1} + t^{q+1} + t^{p+q}$. Because no signs change, there are no negative real-zeros.

* Suppose $p = 2m + 1, q = 2n, V_{-t}(p,q) = 1 - t^{p+1} + t^{q+1} - t^{p+q}$. Because $V_{-t}(p,q) = V_{-t}(q,p)$, it is also true for p = 2m, q = 2n+1.

Date: January 25, 2017.

Key words and phrases. real zeros, jones polynomial, torus.

CHANG LI

* Suppose p = 2m + 1, q = 2n + 1, then $V_{-t}(p,q) = 1 - t^{p+1} - t^{q+1} + t^{p+q}$. It is the case of positive real-zeros, so there are two negative real-zeros -1 and r with -1 < r < 0.

Conjecture 1. For $p \ge 2, q \ge 3$, Ze(p,q) is the positive real-zero of $V_t(p,q)$ which is not equal to +1, then there is approximation formula below

(1.2)
$$\frac{\ln(Ze(p,q)-1)}{\ln(Ze(p,q+1)-1)} \approx \frac{\ln(p+q-3)}{\ln(p+q-2)}$$

This conjecture shows the relationship of the real-zeros distribution of Jones Polynomial of Torus. Computer software has partially verified this conjecture.
