## Abstract

First, divide all integers  $\geq 2$  into 8 kinds, and that formulate each of 7 kinds therein into a sum of 3 unit fractions.

For the unsolved kind, again divide it into 3 genera, and that formulate each of 2 genera therein into a sum of 3 unit fractions. For the unsolved genus, further divide it into 5 sorts, and that formulate each of 3 sorts therein into a sum of 3 unit fractions. For two unsolved sorts i.e.  $4/(49+120c)$  and  $4/(121+120c)$  where  $c \geq 0$ , let us depend on logical deduction to prove them separately.

**Keywords:** Erdős-Straus conjecture; Diophantine equation; unit fraction

## 1. Introduction

The Erdős-Straus conjecture relates to Egyptian fractions. In 1948, Paul Erdős conjectured that for any integer  $n \geq 2$ , there are invariably  $4/n = 1/x + 1/y + 1/z$ , where  $x$ ,  $y$  and  $z$  are positive integers; [1].

Later, Ernst G. Straus further conjectured that  $x, y$  and  $z$  satisfy  $x \neq y, y \neq z$  and  $z \neq x$ , because there are convertible  $1/2r+1/2r = 1/(r+1)+1/r(r+1)$  and  $1/(2r+1)+1/(2r+1) = 1/(r+1)+1/(r+1)(2r+1)$  where  $r \geq 1$ ; [2].

Thus, the Erdős conjecture and the Straus conjecture are equivalent from each other, and they are called the Erdős-Straus conjecture collectively.

As a general rule, the Erdős-Straus conjecture states that for every integer  $n \geq 2$ , there are positive integers  $x, y$  and  $z$ , such that  $4/n = 1/x + 1/y + 1/z$ . Yet, it is still one both unproved and un-negated conjecture hitherto; [3].

## **2. Divide integers $\geq 2$ into 8 kinds and that formulate 7 kinds therein**

First, divide integers  $\geq 2$  into 8 kinds, i.e.  $8k+1, 8k+2, 8k+3, 8k+4, 8k+5, 8k+6, 8k+7$  and  $8k+8$ , where  $k \geq 0$ , and arrange them as follows orderly:

$K \setminus n =$	$8k+1,$	$8k+2,$	$8k+3,$	$8k+4,$	$8k+5,$	$8k+6,$	$8k+7,$	$8k+8$
0,	①,	2,	3,	4,	5,	6,	7,	8,
1,	9,	10,	11,	12,	13,	14,	15,	16,
2,	17,	18,	19,	20,	21,	22,	23,	24,
3,	25,	26,	27,	28,	29,	30,	31,	32,
...	...	...	...	...	...	...	...	...

Excepting  $n=8k+1$ , formulate each of other 7 kinds into  $1/x+1/y+1/z$ :

- (1) For  $n=8k+2$ , there are  $4/(8k+2) = 1/(4k+1) + 1/(4k+2) + 1/(4k+1)(4k+2)$ ;
- (2) For  $n=8k+3$ , there are  $4/(8k+3) = 1/(2k+2) + 1/(2k+1)(2k+2) + 1/(2k+1)(2k+3)$ ;

(3) For  $n=8k+4$ , there are  $4/(8k+4)=1/(2k+3)+1/(2k+2)(2k+3)+1/(2k+1)(2k+2)$ ;

(4) For  $n=8k+5$ , there are  $4/(8k+5)=1/(2k+2)+1/(8k+5)(2k+2)+1/(8k+5)(k+1)$ ;

(5) For  $n=8k+6$ , there are  $4/(8k+6)=1/(4k+3)+1/(4k+4)+1/(4k+3)(4k+4)$ ;

(6) For  $n=8k+7$ , there are  $4/(8k+7)=1/(2k+3)+1/(2k+2)(2k+3)+1/(2k+2)(8k+7)$ ;

(7) For  $n=8k+8$ , there are  $4/(8k+8)=1/(2k+4)+1/(2k+2)(2k+3)+1/(2k+3)(2k+4)$ .

By this token,  $n$  as above 7 kinds of integers be suitable to the conjecture.

### **3. Divide the unsolved kind into 3 genera and that formulate 2 genera therein**

For the unsolved kind  $n=8k+1$  with  $k \geq 1$ , divide it by the modulus 3 into 3 genera to (1) the remainder 0, (2) the remainder 1 and (3) the remainder 2.

Excepting the genus (2), formulate each of other 2 genera as listed below:

(8) For  $n=8k+1$  by the modulus 3 to the remainder 0, i.e. let  $k=3t+1$  with  $t \geq 0$ , then there are  $4/(8k+1)=1/(8k+1)/3+1/(8k+2)+1/(8k+1)(8k+2)$  with  $k \geq 1$ , of course,  $(8k+1)/3$  at here is an integer.

(9) For  $n=8k+1$  by the modulus 3 to the remainder 2, i.e. let  $k=3t+2$  with  $t \geq 0$ , then there are  $4/(8k+1)=1/(8k+2)/3+1/(8k+1)+1/(8k+1)(8k+2)/3$  with  $k \geq 2$ , of course,  $(8k+2)/3$  at here is an integer.

### **4. Divide the unsolved genus into 5 sorts and that formulate 3 sorts therein**

For the unsolved genus  $n=8k+1$  by the modulus 3 to the remainder 1, i.e.

let  $k=3t$  with  $t \geq 1$ , further divide it into 5 sorts, i.e.  $25+120c$ ,  $49+120c$ ,  $73+120c$ ,  $97+120c$  and  $121+120c$ , where  $c \geq 0$ , as listed below.

C,	$25+120c$ ,	$49+120c$ ,	$73+120c$ ,	$97+120c$ ,	$121+120c$ ,
0,	25,	49,	73,	97,	121,
1,	145,	169,	193,	217,	241,
2,	205,	289,	313,	337,	361,
...,	...,	...,	...,	...,	...,

Excepting  $n=49+120c$  and  $121+120c$ , formulate other 3 sorts as follows:

**(10)** For  $n=25+120c$ , there are  $4/(25+120c)=1/(25+120c)+1/(50+240c)+1/(10+48c)$ ;

**(11)** For  $n=73+120c$ , there are  $4/(73+120c)=1/(73+120c)(10+15c)+1/(20+30c)+1/(73+120c)(4+6c)$  ;

**(12)** For  $n=97+120c$ , there are  $4/(97+120c)=1/(25+30c)+1/(97+120c)(50+60c)+1/(97+120c)(10+12c)$ .

For each of listed above 12 equations that express  $4/n=1/x+1/y+1/z$ , please each reader self to make a check respectively.

## **5. Proving the sort $4/(49+120c)=1/x+1/y+1/z$**

For a proof of the sort  $4/49+120c$ , it means that when  $c$  is equal to each of positive integers plus 0, there are  $4/(49+120c)=1/x+1/y+1/z$  .

After  $c$  is endowed with any value,  $4/(49+120c)$  can be substituted by infinitely more a sum of 2 fractions, and that these fractions are different from one another:

$$\begin{aligned}
& 4/(49+120c) \\
&= 1/(13+30c) + 3/(13+30c)(49+120c) \\
&= 1/(14+30c) + 7/(14+30c)(49+120c) \\
&= 1/(15+30c) + 11/(15+30c)(49+120c) \\
&= 1/(16+30c) + 15/(16+30c)(49+120c) \\
&\dots \\
&= 1/(13+\alpha+30c) + (3+4\alpha)/(13+\alpha+30c)(49+120c), \text{ where } \alpha \geq 0 \text{ and } c \geq 0 \\
&\dots
\end{aligned}$$

As listed above, it is observed that we can first let  $1/(13+\alpha+30c)=1/x$ , after that, prove  $(3+4\alpha)/(13+\alpha+30c)(49+120c)=1/y + 1/z$ .

**Proof** When  $c=0$ , such as  $\alpha=1$ , then the fraction  $4/(49+120c)$  got is exactly  $4/49$ , and that there is  $4/49=1/14 + 1/99 + 1/(98 \times 99)$ ;

When  $c=1$ , such as  $\alpha=9$ , then the fraction  $4/(49+120c)$  got is exactly  $4/169$ , and that there is  $4/169=1/52 + 1/(2 \times 169) + 1/(2^2 \times 169)$ .

This manifests that when  $c=0$  and  $1$ ,  $4/(49+120c)$  has been expressed into a sum of 3 unit fractions respectively.

Excepting  $1/(13+\alpha+30c)=1/x$ , in following paragraphs, let us analyze and prove  $(3+4\alpha)/(13+\alpha+30c)(49+120c) = 1/y+1/z$  by  $c=2k$  and  $c=2k+1$  concurrently, where  $k \geq 1$ .

For the numerator  $3+4\alpha$ , excepting itself as an integer, also can express it into the sum of two integers, i.e.  $1+(2+4\alpha)$ ,  $2+(1+4\alpha)$ ,  $3+(4\alpha)$ ,  $(3+3\alpha)+\alpha$ ,

$(1+\alpha)+(2+3\alpha)$ ,  $(2+\alpha)+(1+3\alpha)$ ,  $(3+\alpha)+3\alpha$ ,  $(3+2\alpha)+2\alpha$  and  $(2+2\alpha)+(1+2\alpha)$ .

For the denominator  $(13+\alpha+30c)(49+120c)$ , in reality merely need us to convert  $13+\alpha+30c$ , and that can continue to have  $49+120c$ .

For  $13+\alpha+30c$ , after  $\alpha$  is endowed with values  $\geq 0$ , because begin with each constant i.e. 13, 14, 15... $p$ ..., there is  $\alpha \geq 0$  in like wise, so  $13+\alpha+30c$  can be converted to  $p+\alpha+30c$  where  $p \geq 13$ ,  $\alpha \geq 0$ , and  $c \geq 0$ .

Such being the case, so let  $c=2k$ , then  $(3+4\alpha)/(p+\alpha+30c)$  is exactly  $(3+4\alpha)/(p+\alpha+60k)$ ; again let  $c=2k+1$ , then  $(3+4\alpha)/(p+\alpha+30c)$  is exactly  $(3+4\alpha)/(p+\alpha+60k+30)$ , where  $k \geq 1$ .

In fractions  $(3+4\alpha)/(p+\alpha+60k)$  and  $(3+4\alpha)/(p+\alpha+60k+30)$ , the denominator  $p+\alpha+60k$  can be every integer  $\geq 73$ , and the denominator  $p+\alpha+60k+30$  can be every integer  $\geq 103$ . On the other, for the numerator  $3+4\alpha$ , either it is an integer or the sum of two integers as listed above.

In any case, not only each of numerators as listed above is smaller than a corresponding denominator  $p+\alpha+60k$  or  $p+\alpha+60k+30$ , but also  $p+\alpha+60k$  and  $p+\alpha+60k+30$  contain respectively integers of whole multiples of  $3+4\alpha$  and either of two integers which divide  $3+4\alpha$  into.

Therefore,  $(3+4\alpha)/(p+\alpha+60k)$  can be expressed into a sum of two unit fractions, and  $(3+4\alpha)/(p+\alpha+60k+30)$  can be expressed into a sum of two unit fractions too, in which case  $p \geq 13$ ,  $\alpha \geq 0$  and  $k \geq 1$ , also  $k \geq 1$  i.e.  $c \geq 2$ .

If  $3+4\alpha$  serve as an integer, and from this get an unit fraction, then can

multiply the denominator by 2 to make a sum of two identical unit fractions, afterwards again convert them into the sum of two each other's -distinct unit fractions by the formula  $\frac{1}{2r} + \frac{1}{2r} = \frac{1}{(r+1)} + \frac{1}{r(r+1)}$ .

Let a sum of two unit fractions which expresses  $\frac{(3+4\alpha)}{(p+\alpha+60k)}$  into be written as  $\frac{1}{\mu} + \frac{1}{\nu}$ , again let a sum of two unit fractions which expresses  $\frac{(3+4\alpha)}{(p+\alpha+60k+30)}$  into be written as  $\frac{1}{\phi} + \frac{1}{\psi}$ , where  $\mu$ ,  $\nu$ ,  $\phi$  and  $\psi$  express positive integers.

For  $\frac{1}{\mu} + \frac{1}{\nu}$  and  $\frac{1}{\phi} + \frac{1}{\psi}$ , multiply every denominator by  $49+120c$  reserved in the front, then get  $\frac{1}{\mu(49+120c)} + \frac{1}{\nu(49+120c)} = \frac{1}{y} + \frac{1}{z}$  and  $\frac{1}{\phi(49+120c)} + \frac{1}{\psi(49+120c)} = \frac{1}{y} + \frac{1}{z}$ .

To sum up, we have proved  $\frac{4}{(49+120c)} = \frac{1}{(13+\alpha+30c)} + \frac{1}{y} + \frac{1}{z}$ , to wit  $\frac{4}{(49+120c)} = \frac{1}{x} + \frac{1}{y} + \frac{1}{z}$ .

## **6. Proving the sort $\frac{4}{(121+120c)} = \frac{1}{x} + \frac{1}{y} + \frac{1}{z}$**

For a proof of the sort  $\frac{4}{(121+120c)}$ , it means that when  $c$  is equal to each of positive integers plus 0, there are  $\frac{4}{(121+120c)} = \frac{1}{x} + \frac{1}{y} + \frac{1}{z}$ .

After  $c$  is endowed with any value,  $\frac{4}{(121+120c)}$  can be substituted by infinitely more a sum of 2 fractions, and that these fractions are different from one another :

$$\begin{aligned} & \frac{4}{(121+120c)} \\ &= \frac{1}{(31+30c)} + \frac{3}{(31+30c)(121+120c)}, \\ &= \frac{1}{(32+30c)} + \frac{7}{(32+30c)(121+120c)}, \end{aligned}$$

$$= 1/(33+30c) + 11/(33+30c)(121+120c),$$

$$= 1/(34+30c) + 15/(34+30c)(121+120c),$$

...

$$= 1/(31+\alpha+30c) + (3+4\alpha)/(31+\alpha+30c)(121+120c), \text{ where } \alpha \geq 0 \text{ and } c \geq 0.$$

...

As listed above, it is observed that we can first let  $1/(31+\alpha+30c)=1/x$ , after that, prove  $(3+4\alpha)/(31+\alpha+30c)(121+120c)=1/y + 1/z$ .

**Proof** When  $c=0$ , such as  $\alpha=2$ , then the fraction  $4/(121+120c)$  got is exactly  $4/121$ , and that there is  $4/121=1/33+1/(3 \times 11^2+1)+ 1/(3 \times 11^2)(3 \times 11^2+1)$ ;  
When  $c=1$ , such as  $\alpha=2$ , then the fraction  $4/(121+120c)$  got is exactly  $4/241$ , and that there is  $4/241=1/63+1/(2 \times 3 \times 241)+1/(2 \times 3^2 \times 7 \times 241)$ .

This manifests that when  $c=0$  and  $1$ ,  $4/(121+120c)$  has been expressed into a sum of 3 unit fractions respectively.

Excepting  $1/(31+\alpha+30c)=1/x$ , in following paragraphs, let us analyze and prove  $(3+4\alpha)/(31+\alpha+30c)(121+120c) = 1/y+1/z$  by  $c=2k$  and  $c=2k+1$  concurrently, where  $k \geq 1$ .

For the numerator  $3+4\alpha$ , excepting itself as an integer, also can express it into the sum of two integers, i.e.  $1+(2+4\alpha)$ ,  $2+(1+4\alpha)$ ,  $3+(4\alpha)$ ,  $(3+3\alpha)+\alpha$ ,  $(1+\alpha)+(2+3\alpha)$ ,  $(2+\alpha)+(1+3\alpha)$ ,  $(3+\alpha)+3\alpha$ ,  $(3+2\alpha)+2\alpha$  and  $(2+2\alpha)+(1+2\alpha)$ .

For the denominator  $(31+\alpha+30c)(121+120c)$ , in reality merely need us to convert  $31+\alpha+30c$ , and that can continue to have  $121+120c$ .

For  $31+\alpha+30c$  after  $\alpha$  is endowed with values  $\geq 0$ , because begin with each constant i.e. 31, 32, 33... $q$ ..., there is  $\alpha \geq 0$  in like wise, so  $31+\alpha+30c$  can be converted to  $q+\alpha+30c$ , where  $q \geq 31$ ,  $\alpha \geq 0$  and  $c \geq 0$ .

Such being the case, so let  $c=2k$ , then  $(3+4\alpha)/(q+\alpha+30c)$  is exactly  $(3+4\alpha)/(q+\alpha+60k)$ ; again let  $c=2k+1$ , then  $(3+4\alpha)/(q+\alpha+30c)$  is exactly  $(3+4\alpha)/(q+\alpha+60k+30)$ , where  $k \geq 1$ .

In fractions  $(3+4\alpha)/(q+\alpha+60k)$  and  $(3+4\alpha)/(q+\alpha+60k+30)$ , the denominator  $q+\alpha+60k$  can be every integer  $\geq 91$ , and the denominator  $q+\alpha+60k+30$  can be every integer  $\geq 121$ . On the other, for the numerator  $3+4\alpha$ , either it is an integer or the sum of two integers as listed above.

In any case, not only each of numerators as listed above is smaller than a corresponding denominator  $q+\alpha+60k$  or  $q+\alpha+60k+30$ , but also  $q+\alpha+60k$  and  $q+\alpha+60k+30$  contain respectively integers of whole multiples of  $3+4\alpha$  and either of two integers which divide  $3+4\alpha$  into.

Therefore,  $(3+4\alpha)/(q+\alpha+60k)$  can be expressed into a sum of two unit fractions, and  $(3+4\alpha)/(q+\alpha+60k+30)$  can be expressed into a sum of two unit fractions too, in which case  $q \geq 31$ ,  $\alpha \geq 0$  and  $k \geq 1$ , also  $k \geq 1$  i.e.  $c \geq 2$ .

If  $3+4\alpha$  serve as an integer, and from this get an unit fraction, then can multiply the denominator by 2 to make a sum of two identical unit fractions, afterwards again convert them into the sum of two each other's -distinct unit fractions by the formula  $1/2r + 1/2r = 1/(r+1) + 1/r(r+1)$ .

Let a sum of two unit fractions which expresses  $(3+4\alpha)/(q+\alpha+60k)$  into be written as  $1/\beta+1/\xi$ , again let a sum of two unit fractions which expresses  $(3+4\alpha)/(q+\alpha+60k+30)$  into be written as  $1/\eta +1/\delta$ , where  $\beta$ ,  $\xi$ ,  $\eta$  and  $\delta$  express positive integers.

For  $1/\beta+1/\xi$  and  $1/\eta+1/\delta$ , multiply every denominator by  $121+120c$  reserved in the front, then get  $1/\beta(121+120c)+1/\xi(121+120c) =1/y+1/z$  and  $1/\eta(121+120c)+1/\delta(121+120c) =1/y+1/z$ .

To sum up, we have proved  $4/(121+120c) =1/(31+\alpha+30c)+1/y+1/z$ , to wit  $4/(121+120c) = 1/x+1/y+1/z$ .

The proof was thus brought to a close. As a consequence, the Erdős-Straus conjecture is tenable.
